

scibeamer

A beamer-addon for scientific presentations

Anders Damsgaard

Last revision: September 19, 2019

Usage

`scibeamer` is a flexible package containing functions for quickly creating high-quality scientific presentations using *beamer*.

The functions in the `scibeamer` template are useful for including images scaled to frame size, optionally with references to image source publications.

Building presentations

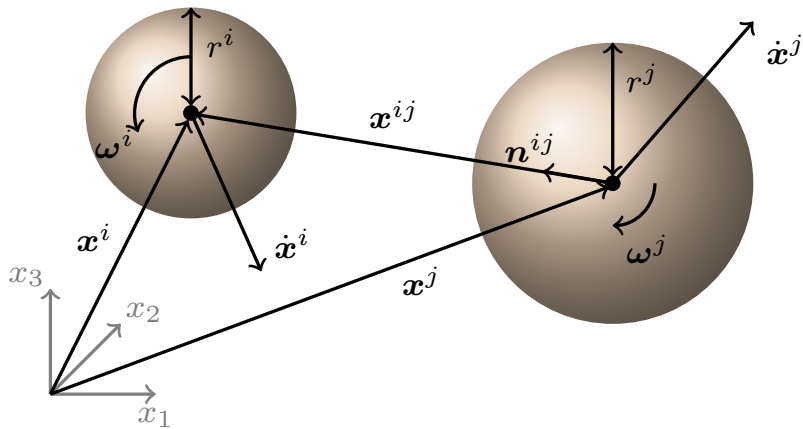

Add images to the `graphics/` folder and change `template.tex` to include the desired content, either using the functions provided by the `scibeamer` package or standard *beamer* commands.

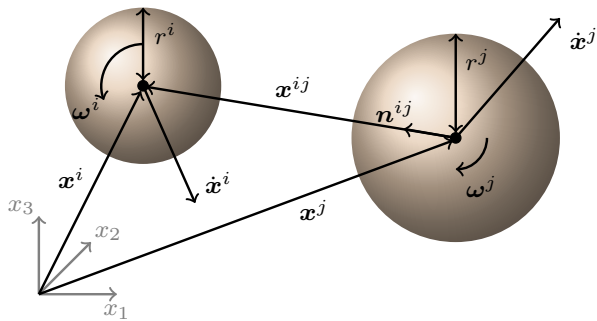

The included `Makefile` allows quick output PDF generation by typing `make` from the command line.

fcite

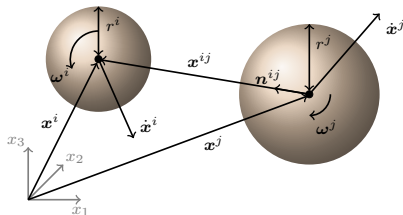

fcite : Add a citation to the bottom left of the frame

Examples

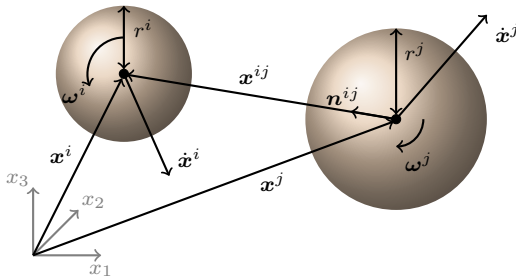

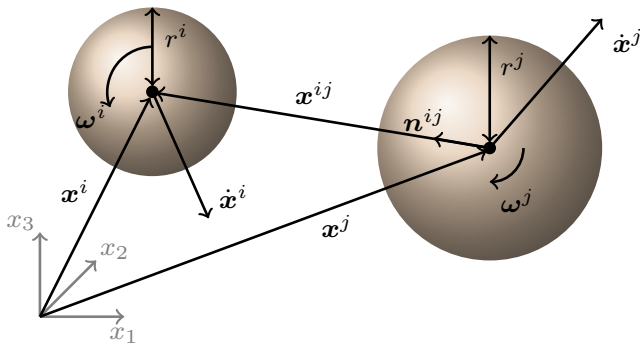

An example image frame using imageframe

An example unscaled image frame using `imageframenoscale`

An example image frame using imageframecite

Conclusions

- `scibeamer` provides macros for quickly creating image-based slides with references using \LaTeX /Beamer
- Output files can be built as pdf using the provided Makefile
- `scibeamer` is available at
<https://src.adamsgaard.dk/scibeamer>
